

The GLW range of **Sheep Feeds** are designed specifically for you system and your needs. They provide the exact balance of nutrients to optimise health and production.

The profitability of a sheep enterprise is highly dependant upon the numbers of lambs reared. As 75% of foetal lamb growth occurs in the last 6 weeks of pregnancy, at a time when ewe appetite declines by 30%, only the highest quality sources of energy and protein should be fed.

Well nourished ewes produce lambs 25% heavier at birth, and their colostrum production is increased by 100%. This leads to much lower lamb mortality and higher growth rates, making the busy lambing period so much more rewarding.

Great improvements in lamb survival due to increased birth-weight and colostrum uptake, and resistance to disease and hypothermia can be achieved by raising the levels of Cobalt with Vitamin B12, Selenium with Vitamin E, Zinc and Iodine fed to pre-lambing ewes, in diets with the correct supply of quality protein and energy.

Characteristics	Advantages
Highly digestible ingredients	No waste and maximum performance.
High energy level	Healthy, fit animals achieving optimum performance.
Quality by-pass protein	Allows efficient use of body reserves, and improves colostrum quality.
Cobalt & Vitamin B12	Improved energy utilisation. Reduces the incidence of Pine and Infertility. Improves growth rate.
Selenium and Vitamin E	Increases fertility, milk production and growth rate. Improves muscle tone and survival rate in lambs
Zinc	Improves disease resistance and wound healing. Encourages better udder, teat, skin and hoof health.
Iodine	Improves reproductive performance and gives stronger lambs

As with all our feeds, the Sheep Feed range comes with the “GLW Positive Response Commitment”, including access to experienced technical support, dedicated customer service, raw material, and transport teams, ensuring that you receive what you want, when you need it.

.....Your feeding system for lifetime performance
